

Minutes of Meeting

Meeting Details

Date: January 28, 2026

Time: 4:00 PM

Platform: Google Meet

Attendees

Client Team: Lakshman Rao Chirumamilla

Student Team: Vikesh Kansal, Advait Dintakurti, Amish Goyal, Keshav Goel, Venya Velmurugan

Meeting Agenda

Follow-up on project requirements, technical architecture discussion, and clarification of development approach for the healthcare chatbot solution.

1. Meeting Context

This was the second scheduled client meeting. However, the primary technical stakeholders (Madhu Nyalam and Manish Ranjan) were unavailable. Lakshman Rao Chirumamilla attended on behalf of the client team but indicated limited technical background to discuss detailed implementation strategies.

2. Student Team Presentation

The student team presented the following items prepared after the first meeting:

Proposed System Architecture

A flowchart depicting the initial system design was shared, showing the following components:

- **Client App / UI (Doctor, Clinician, Patient)** -- Query input and viewing context-aware responses
- **API / Backend Service** -- Authentication (RBAC), session & context management, and query routing & orchestration
- **Vector Store / Embeddings DB** -- Semantic vectors and metadata (PII) using databases like Qdrant, Pinecone, or Milvus
- **Conversation / Session Context Store** -- Conversation state and token history management
- **Secure Audit Logs & Monitoring** -- Access logs and policy checks for compliance
- **Prompt Builder** -- Retrieves relevant embeddings filtered by PII, combines with query and chat history, and sanitizes prompts to minimize PHI leak
- **Private LLM Inference** -- Hosted container on cloud GPUs with autoscaling, running RAG augmented inference with no public APIs used (no PHI leak)

Technical Questions Prepared by Team

The team prepared several technical questions for discussion:

- Access to client's existing codebase for integration planning
- Feedback on proposed system flowchart and architecture approach
- Recommendations for vector database selection
- Discussion on open-source LLM options (team member Vikesh suggested exploring GPT-based open-source alternatives)
- Feasibility of multi-stage pipeline architecture to handle large EMR file sizes efficiently

3. Client Response and Discussion

Lakshman acknowledged the team's preparation but noted:

- He is not part of the technical team and lacks detailed knowledge of the existing system architecture and technology stack

- The technical stakeholders (Madhu Nyalam and Manish Ranjan) would be better suited to address implementation-level questions
- He mentioned the client's existing system uses **Ruby on Rails framework** (noted for future reference during integration phase)

4. Client Instructions and Guidance

Despite limited technical discussion, Lakshman provided clear directives:

Documentation Request

The team should prepare and share a comprehensive note documenting:

- Summary of discussions held so far
- Student team's understanding of project requirements
- Technical questions and data requirements from the client
- Proposed tech stack and architecture approach
- Any dependencies or clarifications needed from client side

This document should be shared in the WhatsApp group for review by the full client team.

Prototype-First Approach

The client emphasized building a working prototype independently before attempting integration:

- Focus on developing a functional proof-of-concept using mock/sample data
- Integration with NanoCare's existing system will be addressed later
- Proceed only after both teams are confident in the prototype's output quality
- This approach allows parallel development without waiting for client system access

Tech Stack Clarification

The client team will provide their technology stack details and preferences in subsequent communications once technical stakeholders review the student team's proposal.

5. Key Outcomes

- The planned technical discussion could not proceed in depth due to unavailability of client technical team
- Clear directive received to document requirements and share via WhatsApp for asynchronous review
- Strategic decision to prioritize prototype development over immediate system integration
- Team to work independently on building functional prototype with sample EMR data

6. Action Items

Action Item	Owner	Description	Deadline
Data & Requirements Documentation	Student Team	Prepare comprehensive documentation covering: discussion summary, requirements, tech stack proposal, client data needs	Within 2-3 days
Share Documentation	Student Team	Upload documentation to WhatsApp group for client technical team review	Within 2-3 days
Prototype Development	Student Team	Begin building functional prototype using mock/sample EMR data independently	Ongoing
Tech Stack Review	Client Team	Review student proposal and provide client tech stack details and preferences	After receiving documentation
Schedule Technical Discussion	Both Teams	Arrange meeting with technical stakeholders (Madhu, Manish) for detailed architecture discussion	TBD

Table 1: Action Items from Meeting 2

7. Unresolved Questions for Future Discussion

The following technical questions prepared by the student team remain pending and will be addressed in subsequent meetings with client technical stakeholders:

- Access to existing codebase and EMR system structure
- Feedback on proposed system architecture flowchart
- Vector database recommendations and preferences
- Open-source LLM options and deployment strategies
- Multi-stage pipeline design to handle large EMR files

8. Next Steps

- Student team to compile requirements documentation and share in WhatsApp group
- Continue research and prototype development independently using publicly available medical datasets or mock EMR data
- Await client technical team's review and schedule follow-up meeting for detailed technical discussion
- Focus on demonstrating a working proof-of-concept before integration planning
